

Relinking your catalog with your images

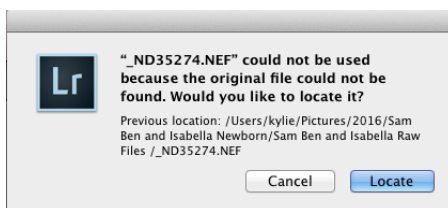

When your job is complete, the new catalog (.lrcat) and preview (.lrdata) files will be uploaded to either your dropbox folder or your folder on our in-house server. The zipped folder will be located in the **complete** folder.

To relink your raw files with the new catalog just follow these few steps:

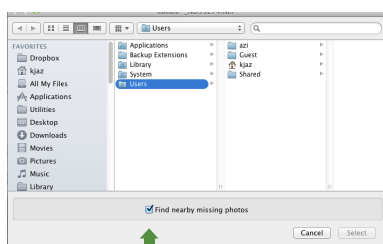

- Put the .lrcat & .lrdata file in the folder with your raw images. You can replace the file you previously had or keep both. You will need to rename one of them.
- Double click the .lrcat file to open it in Lightroom
- Your files will come up and you can see an exclamation mark on the right hand corner of each image box

- Click on the exclamation mark and a warning will come up.

- Click locate and navigate to the folder you've put the files.
- Find the correct file. In the case of this example it's _ND35274.NEF. Make sure that 'find nearby missing photos' is checked.

- Once you've found the image, hit select and it will relink all the photos.
- Now the way we do things is to reject (or X) the photos that don't make it. To just see the photos that made it and have been edited you have to enable filters (⌘ + L) or File > Library Filter > Enable Filters
- You can then show the filter File > Library Filter > Filter by flag > Flagged and Unflagged photos
